ABSTRACT

Raich, J. W., C. S. Potter, and D. Bhagawati. 2002. Interannual variability in global soil respiration, 1980-94. *Global Change Biology* 8:800-812. doi: 10.3334/CDIAC/lue.ndp081

We used a climate-driven regression model to develop spatially resolved estimates of soil-CO₂ emissions from the terrestrial land surface for each month from January 1980 to December 1994, to evaluate the effects of interannual variations in climate on global soil-to-atmosphere CO₂ fluxes. The mean annual global soil-CO₂ flux over this 15-y period was estimated to be 80.4 (range 79.3-81.8) Pg C. Monthly variations in global soil-CO₂ emissions followed closely the mean temperature cycle of the Northern Hemisphere. Globally, soil-CO₂ emissions reached their minima in February and peaked in July and August. Tropical and subtropical evergreen broad-leaved forests contributed more soil-derived CO₂ to the atmosphere than did any other vegetation type (~30% of the total) and exhibited a biannual cycle in their emissions. Soil-CO₂ emissions in other biomes exhibited a single annual cycle that paralleled the seasonal temperature cycle. Interannual variability in estimated global soil-CO₂ production is substantially less than is variability in net carbon uptake by plants (i.e., net primary productivity). Thus, soils appear to buffer atmospheric CO₂ concentrations against far more dramatic seasonal and interannual differences in plant growth. Within seasonally dry biomes (savannas, bushlands,

and deserts), interannual variability in soil-CO₂ emissions correlated significantly with interannual differences in precipitation. At the global scale, however, annual soil-CO₂ fluxes correlated with mean annual temperature, with a slope of 3.3 PgCY⁻¹ per degree Celsius. Although the distribution of precipitation influences seasonal and spatial patterns of soil-CO₂ emissions, global warming is likely to stimulate CO₂ emissions from soils.

The user may view and print the body of this publication ([Raich, J. W., C. S. Potter, and D. Bhagawati. 2002. *Note: one daily grid exists for each month of record between January 1980 and December 1994.

1. BACKGROUND INFORMATION

The authors estimated the seasonal and spatial distribution of global soil-CO₂ emissions following the regression based modeling approach of [Raich and Potter \(1995\)](#). This database, therefore, contains global, spatially explicit (0.5-degree grid cells) and temporally explicit model output of soil-CO₂ emissions. The calculated emissions include the respiration of both soil organisms and plant roots.

Please note that **NDP-081** is an *update* to **DB1015**. Specifically, DB1015 used long-term climate data as model input while NDP-081 utilizes new climate and land cover data files. Please refer to [Raich et al. 2002](#), (provided with permission from Blackwell Science Ltd.) for more information.

2. DATA CHECKS PERFORMED BY CDIAC

One of the roles of the Carbon Dioxide Information Analysis Center (CDIAC) is quality assurance (QA) of data. The QA process is an important component of the value-added concept of assuring accurate, usable information for researchers, because data received by CDIAC are rarely in condition for immediate distribution, regardless of source. The following summarizes the QA checks performed on the data files:

1. Calculated the mean annual global soil-CO₂ flux over the 15 year period (1980-1994) using the monthly grids. The value (80.4 Pg) was in agreement with the published values of Raich et al. 2002. Note: cells that were assigned a land cover value of 14 (polar ice and rockland) were assigned a value of zero in the monthly and daily data files provided by CDIAC (following the methods used by Raich et al. 2002).
2. Calculated the mean annual global soil-CO₂ flux (see above) by land cover type (DeFries et al. 1998). The values were in agreement with those published in Raich et al. 2002.
3. Used the daily data grids to derive monthly data grids by multiplying them by landarea (halfarea.e00 or halfarea.dat) and number of days per month (methods described by author). When these derived grids were compared with the monthly grids included with this data set, they differed slightly. These differences are probably the result of varying levels of precision in the software used to create them.

Note: 1 Pg C = 1.e15 g C

4. HOW TO OBTAIN THE DATA AND DOCUMENTATION

These data may be used with a raster geographic information system (GIS) or non-GIS database systems. This database (NDP-081) is available free of charge from CDIAC. The files are available, via the Internet, from CDIAC's World-Wide-Web site (<http://cdiac.ornl.gov>), or from CDIAC's anonymous file transfer protocol (FTP) area ([cdiac.ornl.gov](ftp://cdiac.ornl.gov)) as follows:

1. FTP to [cdiac.ornl.gov](ftp://cdiac.ornl.gov) (128.219.24.36).
2. Enter "ftp" as the user id.
3. Enter your electronic mail address as the password (e.g., fred@zulu.org).
4. Change to the directory "pub/ndp081" (i.e., use the command "cd pub/ndp081").
5. Set ftp to get ASCII files by using the ftp "ascii" command.
6. Retrieve the ASCII database documentation file by using the ftp "get ndp081.txt" command.
7. Set ftp to get compressed data files by using the ftp "binary" command.
8. Retrieve the compressed data files by using the ftp "mget *.gzip" command.
9. Exit the system by using the ftp "quit" command.

For **non-Internet data acquisitions** (e.g., floppy diskette or CD-ROM) or for additional information, contact:

5. LISTING OF FILES PROVIDED

This database consists of twelve data files (*.dat), four text files (*.txt) and thirteen graphics files (*.gif).

Note: this data is provided in three formats as a courtesy to our users (ASCII, ESRI export, and netCDF).

Data files include:

1. monthly_dat.tar.gz
2. monthly_e00.tar.gz
3. monthly_means_dat.tar.gz
4. monthly_means_e00.tar.gz
5. daily_dat.tar.gz
6. daily_e00.tar.gz
7. halfarea.dat
8. halfarea.e00
9. landcvr3.dat
10. landcvr3.e00
11. sr_total_0.5degree.nc.gz
12. sr_daily_0.5degree.nc.gz

Text files include:

1. ndp081.txt
2. landcvr3.txt
3. sr_total_0.5degree.header
4. sr_daily_0.5degree.header

Graphics files include:

1. map_yrnm.gif
2. mean01.gif
3. mean02.gif
4. mean03.gif
5. mean04.gif
6. mean05.gif
7. mean06.gif
8. mean07.gif
9. mean08.gif
10. mean09.gif
11. mean10.gif
12. mean11.gif
13. mean12.gif

6. DESCRIPTION OF THE DOCUMENTATION FILES

The [ndp081.txt](#) file is an ASCII text equivalent of this document.

The [landcvr3.txt](#) file is a key to the land cover classification codes used in the grid landcvr3.

The [sr_total_0.5degree.header](#) file is a companion to the netCDF file sr_total_0.5degree.nc.gz.

The [sr_daily_0.5degree.header](#) file is a companion to the netCDF file sr_daily_0.5degree.nc.gz.

7. DESCRIPTION, FORMAT, AND PARTIAL LISTINGS OF THE DATA FILES

Twelve data files are provided with this data package. All grids are global in extent and are unprojected (decimal

degrees).

- **monthly_dat.tar.gz:**

Grid files of MONTHLY predicted soil CO₂-C emissions for every month from January 1980 to December 1994. Units are MgC/gridcell/month. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 180 monthly data files in ASCII format (Please see section below for description). The first two digits in the filename refer to the year and the last two digits refer to the month.

- **monthly_e00.tar.gz:**

Grid files of MONTHLY predicted soil CO₂-C emissions for every month from January 1980 to December 1994. Units are MgC/gridcell/month. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 180 monthly data files in ESRI export format (*e00) (Please see section below for description). The first two digits in the filename refer to the year and the last two digits refer to the month.

- **monthly_means_dat.tar.gz:**

Grid files containing MONTHLY MEAN soil CO₂-C emissions as calculated from the monthly data files described above (Jan. 1980-Dec. 1994). Units are MgC/gridcell/month. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 12 data files in ASCII format (Please see section below for description). The last two digits in the filename refer to the month.

- **monthly_means_e00.tar.gz:**

Grid files containing MONTHLY MEAN soil CO₂-C emissions as calculated from the monthly data files described above (Jan. 1980-Dec. 1994). Units are MgC/gridcell/month. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 12 data files in ESRI export format (*e00) (Please see section below for description). The last two digits in the filename refer to the month.

- **daily_dat.tar.gz:**

Grid files containing predicted DAILY soil CO₂-C emissions representing every month from January 1980 through December 1994 (one daily file per month). Units are gC/m²/day. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 180 data files in ASCII format (Please see section below for description). The first two digits in the filename refer to the year and the last two digits refer to the month.

- **daily_e00.tar.gz:**

Grid files containing predicted DAILY soil CO₂-C emissions representing every month from January 1980 through December 1994 (one daily file per month). Units are gC/m²/day. The gzip and tar utilities were used to compress these files in UNIX. This archive contains 180 data files in ESRI export format (*e00) (Please see section below for description). The first two digits in the filename refer to the year and the last two digits refer to the month.

- **sr_total_0.5degree.nc.gz:**

NetCDF file composed of grids depicting MONTHLY predicted soil CO₂-C emissions for every month from January 1980 to December 1994. Units are MgC/gridcell/month. The gzip utility was used to compress the netCDF file in UNIX. (Please see section below for format description).

- **sr_daily_0.5degree.nc.gz:**

NetCDF file composed of grids depicting predicted DAILY soil CO₂-C emissions representing every month from January 1980 through December 1994 (one daily file per month). Units are gC/m²/day. The gzip utility was used to compress the netCDF file in UNIX. (Please see section below for format description).

- **halfarea.dat:**

A 0.5 degree lat/lon file with grid cell area information. Units are km²/grid cell. This file was used by the authors in the global summation of soil emissions. This file is in ASCII format (Please see section below for description).

- **halfarea.e00:**

A 0.5 degree lat/lon file with grid cell area information. Units are km²/grid cell. This file was used by the authors in the global summation of soil emissions. The file is in ESRI export format (*e00) (Please see section below for description).

- **landcvr3.dat:**

A 0.5 degree land cover classification based on Defries et al. (1998). This file was used by the authors in the global summation of soil emissions by land cover type. The file is in ASCII format (Please see section below for description).

- **landcvr3.e00:**

A 0.5 degree land cover classification based on Defries et al. (1998). This file was used by the authors in the global summation of soil emissions by land cover type. The file is in ESRI export format (*e00). (Please see section below for description)

File formats:

ASCII GRID:

Each file contains a single ASCII array with integer values. Coordinates listed below are in decimal degrees.

The ASCII file consists of header information containing a set of keywords, followed by cell values in row-major order. The file format is:

```

NCOLS xxx
NROWS xxx
XLLCORNER xxx
YLLCORNER xxx
CELLSIZE xxx
{NODATA_VALUE xxx}
row 1
row 2
.
.
.
row n

```

where xxx is a number, and the keyword NODATA_VALUE is optional and defaults to -9999. Row 1 of the data is at the top of the grid, row 2 is just under row 1 and so on. The end of each row of data from the grid is terminated with a carriage return in the file.

```
These six lines (header) appear in all of the data files, e.g.:
ncols 720
nrows 360
xllcorner -180
yllcorner -90
cellsize 0.5
NODATA_value -9999
```

To import this file into ArcInfo use the following command at an ARC prompt:

```
ASCIIGRID (in_ascii_file) (out_grid) {INT | FLOAT}
```

Arguments

```
(in_ascii_file) - the ASCII file to be converted.
(out_grid) - the name of the grid to be created.
{INT | FLOAT} - the data type of the output grid.
INT - an integer grid will be created.
FLOAT - a floating-point grid will be created.
```

Note: This data can also be imported into ArcView (with Spatial Analyst) and ArcGis as ASCII Raster data.

ARC/INFO EXPORT FILES:

ESRI EXPORT file (*.e00) - is a proprietary format that can be imported into ARC/INFO GRID using the following command at an ARC prompt:

```
IMPORT (option) (interchange_file) (output)
```

Arguments

```
(option) - GRID
(interchange_file) - the name of the *.e00 file to be converted
(output) - a user specified output file
```

NETCDF FILES:

Network Common Data Form (netCDF) is an interface for array-oriented data access, and is commonly utilized by climate modelers. Please see [netCDF](#) for a complete description of netCDF files. To obtain a list of available software for viewing and manipulating netCDF files, go to [list](#).
